

DRACO AI

Human-Enabled AI Design Process

Draco AI is developed as a tool-agnostic, **web-based real-time sketching/collaging tool**, that allows architects & designers to add their sketches, or use their digital pen to sketch on the canvas, add images from across the web to collage - and then see their design intent render in any style of their preference in a matter of seconds! Then we leverage AI to **generate a text description of the design outcome** based on the render and the initial client's brief.

Narrative

Architectural Style

The design of the building incorporates contemporary architectural elements, showcasing clean lines and a minimalist aesthetic. The façade is characterized by a combination of smooth plaster finishes and vertical louvers which add texture and visual interest. The use of large floor-to-ceiling windows enhances the building's modern appeal while facilitating abundant natural light penetration into the interior spaces.

Building Typology

This building is designed as a modern residential structure, potentially serving as a luxury family home. The structure is multi-level, with overlapping volumes that create dynamic cantilevered forms, contributing to a visually intriguing and structurally sophisticated appearance.

Functional Areas

The residence includes various functional areas designed for comfort and accessibility. The ground level appears to house expansive living and communal spaces, indicated by wide glass doors and an open porch area. Upper levels likely contain private spaces such as bedrooms
