Team SyncAI

May, 2025

User

Company employees and project teams who need to efficiently manage and extract insights from large volumes of emails and meeting notes.

Pain Point

The **manual** and **time-consuming** process of sorting, categorizing, and retrieving relevant information from emails and meeting notes, leading to **inefficiencies**, potential **miscommunications** and **loss of critical project data**.

Measurable KPI

- a. **Time Savings:** Reduce the time spent manually sorting emails and meeting notes by up to 70%.
- b. **Cost Efficiency:** Minimize project administrative related overhead costs by automating repetitive tasks & reduction in steps.
- c. **Quality Improvement:** Increase accuracy in information retrieval and reduce errors in project documentation.
- d. **Response Efficiency:** Enhance the speed of answering design brief design-related queries by up to 60% through AI-powered assistance.

Gap of the Current Commercial Solutions

Current commercial solutions such as basic email categorization, & meeting transcription services tools lack an **integrated** AI-driven approach that combines structured data extraction, processing, and agentic AI response capabilities. They do not provide an **end-to-end workflow** that connects email sorting, meeting note classification, data integration and intelligent query response in a seamless manner.

Data Limitation

Unstructured data (e.g. Images, links & attachments) in emails and meeting notes remains difficult to process efficiently without manual effort.

Process Limitation

Existing tools lack automation in extracting and structuring meeting notes and emails into usable formats.

Existing Tools Limitation

Traditional tools do not integrate multiple AI agents to handle information categorization, combination, and natural language responses in a streamlined manner.

Impact, Size & Scale of Problem

Impact

Mismanaged project documentation can lead to **miscommunication, project delays, abortive works, and increased costs.**

Size

Medium to large projects handle hundreds of emails and meeting notes weekly, making manual processing highly inefficient.

Scale

The solution can scale across **multiple** teams and industries beyond architecture, including engineering and consulting teams.

Measurable Losses & Its Impact

Time Lost

Employees can spend up to 10+ hours per week manually sorting through emails and meeting notes.

Financial Loss

Inefficiencies can drive the need for resources diversion to data management from project critical value add tasks.

Evidence Tracking

Lack of documented proof can lead to difficulty in justifying variation orders.

Operational Inefficiency

Reduced productivity and collaboration due to inaccessible or lost critical information.

1. Developing an AI workflow that processes emails and meeting notes into structured data tables.
2. Automating email sorting into subject, body, sender, date, and attachments.
3. Automating meeting note sorting into subject, body, personnel, date, and content.
4. Converting decision making data into design brief updates.
5. Leveraging on Language Learning Model's to answer users' inquiries based on extracted data.

Scope of Proof of Concept

1. Automate the extraction and classification of unstructured emails and meeting notes.
2. Provide an AI-driven query response system to improve information accessibility.
3. Validate efficiency gains and cost reductions through measurable KPIs.
4. Ensure seamless integration with Microsoft 365 & AI agents into an automated workflow.

Objectives of Proof of Concept

GenAI:

Enables advanced natural language understanding for question answering and content summarization.

Agentic AI Workflow:

Uses multiple AI agents for sequential tasks, ensuring a structured, automated process:

1. Sorting emails into structured data.
2. Sorting meeting notes into structured data.
3. Merging extracted data for holistic project documentation.
4. Providing AI-driven responses to team queries.

How GenAI & Agentic AI help?

Approach and Tools

Data Used:

- Emails and meeting notes extracted via connectors through Automate.
- Client Minutes in PDF format.
- Analytic summaries in CSV or XLSX format.
- Process Flow: PDF & Outlook → CSV → → JSON → XLSX

Reasoning Tool: OpenAI 4o for text & document processing, chosen for its effective data interpretation & strong reasoning capabilities.

Fetching Information: Connector's through Automate, selected for its ease of access with Sharepoint, Outlook and other Microsoft Apps, while maintaining Data Security.

APPROACH:

TOOLS:

LEGEND:

INPUT

SCRIPT

AI AGENT

OUTPUT

Checks are required to ensure that no data is omitted or hallucinated during the conversion and summary process.

Data Checking & Validation

Due to the inconsistencies of AI outputs, the format might not be suitable for data parsing downstream.

Parsing Complexity

Character limits & a file size limit of 25 mb means that the information process are not thorough

AI Limitations

The AI struggles to understand decision-making hierarchies within emails, leading to hallucinations.

Decision Supersedence

Currently experimenting with data filtering and extraction methods to refine inputs before AI processing.

Iterative testing and feedback loops to improve decision-tracking mechanisms within AI workflows.

Hurdles and Obstacles

Manual Validation

Checking AI-processed results against raw emails and meeting notes.

Supersedence Testing

Ensuring AI correctly identifies the most relevant data when multiple sources conflict.

Tests Conducted

Time Efficiency

Measuring AI interpretation speed and time savings per task.

Cost Analysis

Time VS manpower cost

Quality Assurance

Manual validation of AI-extracted content accuracy.

Manpower Efficiency

Measuring reductions in required personnel for document processing.

Productivity Gains

Comparing AI-driven document retrieval versus traditional manual searching.

Measuring Results

Outcome and What's Next?

What were the outcomes and benefits of the solution?

What are the next development and implementation plan?

Documentation?

Allowed team members to focus on other value-added tasks

Easier tracking of decisions made inside a large numbers of Emails and Minutes

Automated information validation for larger and higher input

Information Flagging for potential clashes between decisions

Follow up of decisions forgotten made within or by other consultants
